WARNING: Do not add or remove modules with field power applied.

Step One: With latch in "locked" position, align connectors on the side of each module and stack by pressing together. Click indicates lock is engaged.

Step Two: Attach field wiring using the removable terminal block or ZIPLink wiring system.

Check all latches are secure after modules are connected.

Step Three: To unstack modules, pull locking latch up into the unlocked position and then pull modules apart.

Use any QR Code reader application to display the module's product insert.

If desired, assign a *User Tagname* to each input point (channel) selected and to each *Status Bit Item*.

Linear Scaling

The Scale (Linear) function can be used to:

- Convert an application specific range to range which is native to the analog output module.
- Make other linear conversions in ranges appropriate to the application.

Select the Input and Output tags appropriate for the application. Convert raw input signals to engineering units for use in the program, or convert engineering units to output signals for control purposes

| Input | Output |
|-------|--------|
| 0 | 220 |
| 65535 | 12500 |

Non-Linear Scaling

The Scale (Non-Linear) function can be used for Non-Linear applications.
