

Universal Signal Conditioners

The Universal Signal Conditioners from AutomationDirect are extremely versatile providing the flexibility to convert, transmit, scale and isolate signals from a wide variety of process sensors and controller I/O. With models 884114 and 884116, scalable input signal types supported include mA, VDC, thermocouple with internal cold junction compensation, 2-, 3-, 4-wire RTDs, linear resistance or potentiometer signals. Numerous selectable input ranges and two point field scalability will handle hundreds of applications. Outputs include mA, VDC; two individually programmable relays on the 884116 are used for alarming and control functions. The isolated universal supply voltage input eliminates the need for separate transformers or power supplies. Isolation is also provided between input and output.

The signal conditioners are easily configured with the 884501 menu-structured LCD programming/display module (a computer running special calibration software is not required and there are no confusing DIP switches or jumpers to set). Automatic scrolling Help text identifies each menu item. The detachable programming/display module can store and transfer configuration parameters from one signal conditioner to another, minimizing set-up time in multiple unit applications. Programming is available in seven different languages and the programming/display module can be password protected to prevent unauthorized changes to the configuration. When not used for configuration, the programming/display module can remain on the signal conditioner to display the input signal value and engineering units, output signal, and relay status (if equipped). A process simulation function allows manual manipulation of the input signal to control the output signal for trouble-shooting and checkout.
